Goods transportation demand and increasing customers' needs requires original solutions for end-2-end logistical chain digitalisation and intermodal port/inland nodes optimisation.

This platform offers a modular solution for planning, management, implementation, monitoring and analysis of modal interchange nodes, logistics systems and intermodal logistical chains.

This solution enables cooperation between operators, allowing document and information management in order to optimise processes and give a thorough and integrated view of the situation inside the logistical node; supporting goods management, handling operations and integration with maritime and overland transports, on roads and on rails; processing vehicles and people transit in logistical areas and monitoring dangerous cargo, therefore giving critical assistance to the logistical system's security and environmental sustainability
